

GREETINGS FROM

**DEPARTMENT OF PEDIATRICS, SDUMC,
SDUAHER, KOLAR-563103**

Type 1 diabetes mellitus (T1DM) is a chronic illness characterized by the body's inability to produce insulin due to the autoimmune destruction of the beta cells in the pancreas. Most pediatric patients with diabetes have type 1 and a lifetime dependence on exogenous insulin.

Pediatric-onset diabetes is different from adult diabetes because of its distinct epidemiology, pathophysiology, developmental considerations, and response to therapy. In caring for children and adolescents, clinicians need to be mindful of the child's evolving developmental stages and must adapt care to the child's needs and circumstances.

Collaborative research and technological advances have increased the understanding of T1DM and led to advances in treatment. However, management of T1DM in children and adolescents remains imperfect, requiring unending vigilance and behavioral intervention. While it is burdensome to all affected individuals and their families, it is particularly challenging to those with limited resources and skills.
