### **Program Description**

Recent advances in surgical, immunosuppressive and monitoring protocols have led to the significant improvement of overall one-year kidney allograft outcomes. Nonetheless, there has not been a significant change in long-term kidney allograft outcomes.

Liver cancer is the fifth most common cancer globally and the fourth most common cause of cancer-related death. Hepatocellular carcinoma (HCC) accounts for about 90% of liver cancers and is associated with a 5-year overall survival (OS) of 10–15%, mostly due to late diagnosis. However, 5-year OS reaches 50–70% when patients are diagnosed at an early stage and can access curative treatments such as liver resection (LR), liver transplantation (LT) and ablation. Recent studies have shown encouraging results when LR is extended to more advanced stages, which supports the need to redefine the frontiers of surgical resection and its place in the therapeutic algorithm.

Less than 100 lung transplants are performed annually across India at present. Almost all of these are from two cities at the current moment; Chennai in Tamilnadu and Hyderabad in Telangana with isolated single digit lung transplants in few other cities across India.
